MD-1410-WT - Winter Test Kit

## Flex-Moshon Towing System Adapted for winter testing in the snow

Moshon Data has developed the first Flex-Moshon EVT towing system for winter testing in the snow. Specially adapted for winter AEB testing. The Flex-Moshon uses expertly designed 'Skids' made from low-friction nylon instead of wheels which allows the towing system to glide across snow and ice.

The EVT will behave in the same way during each test as if was being performed with wheels, following the path of the towing vehicle.

To achieve this, the pneumatic system is filled with nitrogen gas instead of air, using dedicated nitrogen regulators for each hose preventing moisture build up in the system in extreme weather conditions.

This allows it to work in the harshest of environments.

If you already own a Flex-Moshon towing system, you can add the winter testing accessory pack.
